

# Assignment 1

Deadline:

1. Prove the König theorem: Let  $G$  be bipartite, then cardinality of maximum matching = cardinality of minimum vertex cover.

2. Consider the algorithm **Negative-Dijkstra** for computing shortest paths through graphs with negative edge weights (but without negative cycles) Note that **Negative-Dijkstra** shifts all edge

---

**Algorithm 1** Algorithm 1: Negative-Dijkstra( $G, s$ )

---

```
1:  $w^* \leftarrow$  minimum edge weight in  $G$ ;  
2: for  $e \in E(G)$  do  
3:    $w'(e) \leftarrow w(e) - w^*$   
4: end for  
5:  $T \leftarrow \text{Dijkstra}(G', s)$ ;  
6: return weights of  $T$  in the original  $G$ ;
```

---

weights to be non-negative (by shifting all edge weights by the smallest original value) and runs in  $O(m + \log n)$  time.

Prove or Disprove: **Negative-Dijkstra** computes single-source shortest paths correctly in graphs with negative edge weights. To prove the algorithm correct, show that for all  $u \in V$  the shortest  $s - u$  path in the original graph is in  $T$ . To disprove, exhibit a graph with negative edges, with no negative cycles where **Negative-Dijkstra** outputs the wrong "shortest" paths, and explain why the algorithm fails.

3. Consider a weighted, directed graph  $G$  with  $n$  vertices and  $m$  edges that have integer weights. A graph walk is a sequence of not-necessarily-distinct vertices  $v_1, v_2, \dots, v_k$  such that each pair of consecutive vertices  $v_i, v_{i+1}$  are connected by an edge. This is similar to a path, except a walk can have repeated vertices and edges. The length of a walk in a weighted graph is the sum of the weights of the edges in the walk. Let  $s, t$  be given vertices in the graph, and  $L$  be a positive integer. We are interested counting the number of walks from  $s$  to  $t$  of length exactly  $L$ .

- Assume all the edge weights are positive. Describe an algorithm that computes the number of graph walks from  $s$  to  $t$  of length exactly  $L$  in  $O((n + m)L)$  time. Prove the correctness and analyze the running time
- Now assume all the edge weights are non-negative (but they can be 0), but there are no cycles consisting entirely of zero-weight edges. That is, for any cycle in the graph, at least one edge has a positive weight.  
Describe an algorithm that computes the number of graph walks from  $s$  to  $t$  of length exactly  $L$  in  $O((n + m)L)$  time. Prove correctness and analyze running time.

4. The diameter of a connected, undirected graph  $G = (V, E)$  is the length (in number of edges) of the longest shortest path between two nodes. Show that if the diameter of a graph is  $d$  then there is some set  $S \subseteq V$  with  $|S| \leq n/(d-1)$  such that removing the vertices in  $S$  from the graph would break it into several disconnected pieces.

5. Let  $G$  be a  $n$  vertices graph. Show that if every vertex in  $G$  has degree at least  $n/2$ , then  $G$  contains a Hamiltonian path.

6. Show how to find a minimal cut of a graph (not only the cost of minimum cut, but also the set of edges in the cut).

7. Let  $G(V, E)$  be a connected undirected graph with a weight  $w(e) > 0$  for each edge  $e \in E$ . For any path  $P_{u,v} = \langle u, v_1, v_2, \dots, v_r, v \rangle$  between two vertices  $u$  and  $v$  in  $G$ , let  $\beta(P_{u,v})$  denote the maximum weight of an edge in  $P_{u,v}$ . We refer to  $\beta(P_{u,v})$  as the **bottleneck weight** of  $P_{u,v}$ . Define

$$\beta^*(u, v) = \min\{\beta(P_{u,v}) : P_{u,v} \text{ is a path between } u \text{ and } v\}.$$

Give a polynomial algorithm to find  $\beta^*(u, v)$  for each pair of vertices  $u$  and  $v$  in  $V$  and a proof of the correctness of the algorithm.

8. Let  $G = (V, E)$  be a directed graph. Give a linear-time algorithm that given  $G$ , a node  $s \in V$  and an integer  $k$  decides whether there is a walk in  $G$  starting at  $s$  that visits at least  $k$  distinct nodes.

9. **Minimum Bottleneck Spanning Tree:** Given a connected graph  $G$  with positive edge costs, find a spanning tree that minimizes the most expensive edge.
